

PULSAR[®]

High Performance Apparel

With a history dating back to 1979, PULSAR® has set the benchmark for high-visibility protective workwear, combining durability, comfort, and certified safety for demanding environments. Trusted by millions, our designs keep workers safe and seen across rail, construction, energy, and infrastructure. British by Design and shaped by real worker feedback, our collections are made to move with you, last longer, and perform when it matters most. Sustainability drives our approach, from carbon reporting and the use of recycled materials, through to our Recycle and Reward initiative, which helps close the loop, supporting a more circular PPE lifecycle.

- Four smooth-glide wheels
- Padded, adjustable shoulder straps
- Wrap around lumbar protector for when used as a backpack

At PULSAR®, every garment containing recycled polyester is made using GRS-certified fabric. The Global Recycled Standard, led by Textile Exchange, is a robust international certification that ensures recycled materials are authentic, responsibly sourced, and traceable from origin to finished product. By using GRS-certified recycled polyester, we align with globally recognised definitions of “recycled”, help reduce the impact of textile production on people and the planet and give our customers confidence in the sustainability of the workwear they choose.

The Microfibre Consortium is a global, collaborative initiative focused on reducing microfibre pollution from textiles. They bring together brands, manufacturers, scientists, and other stakeholders to research, test, and develop practical solutions that minimize the release of microfibres into the environment during the production, use, and washing of clothing. By submitting our garments for testing through the consortium, PULSAR® is actively working to understand and reduce the environmental impact of fibre loss. This helps us improve product design, select better materials, and contribute to industry-wide efforts to tackle microplastic pollution.

We work with sustainability consultancy Positive Planet to measure our carbon footprint, embed sustainability into our business practices, and build internal awareness through training and stakeholder engagement. Through annual reporting and strategic adjustments, we've made significant progress over the last three years. We've reduced our carbon footprint by 49.7% since 2022, including a 35.7% drop between 2023 and 2024. This ongoing partnership helps ensure we make informed, lasting changes that support a lower-impact, more sustainable future.

Carbonfact helps us measure and track carbon emissions across a product's full lifecycle, showing where our biggest environmental impacts are so we can reduce them effectively. Lifecycle Analysis (LCA) uses this data to assess environmental impact from raw materials to end-of-life, helping us design more sustainable workwear. The (DPP) Digital Product Passports store key product details, like materials, production, and carbon footprint, improving transparency and traceability for customers and partners. Together, these tools help us cut emissions, make better design choices, and build trust through clear, verifiable sustainability data.

MYGroup provide commercial disposal and end-to-end recovery for all your waste requirements. With over 30 years' experience in the waste and recycling industry, MYGroup are a proudly family-run business; simplifying waste, delivering long-term benefits through reduction, landfill diversion and closed-loop recycling, enhancing environmental credentials. With MYGroup and their MYReFactory team, they remanufacture all manner of textiles into new and useful products. Textiles go through hand sorting, grading, and processing such as deep cleaning and de-construction, before being handed over to their design team and production team.

Sedex is a global membership organisation that helps businesses manage and improve ethical, social, and environmental performance across their supply chains. It provides a central data-sharing platform where companies can store, share, and analyse information on labour standards, health and safety, environmental practices, and business ethics. Overall, Sedex is important for ensuring ethical responsibility, supporting regulatory compliance, mitigating risks, and building trust through transparent and responsible supply chain practices.

OEKO-TEX® is a globally recognised certification system for textiles and leather products, focused on testing for harmful substances and ensuring product safety. The certification used is STANDARD 100 by OEKO-TEX®, which verifies that every component of a product (fabric, threads, dyes, trims, etc.) has been tested and is safe for human use.

A Module D Audit (Production Quality Assurance) is a regulatory assessment where a manufacturer's quality management system (QMS) for production, inspection, and testing is reviewed and approved by a Notified or Approved Body. Instead of testing every product individually, the focus is on ensuring the system consistently produces compliant products. The audit examines documentation, processes, testing methods, and traceability, with ongoing surveillance to maintain compliance. This approach reduces testing costs, speeds up market access, improves quality control, and enhances credibility, while also supporting regulatory compliance, lowering risk, and enabling efficient scaling of production.

Rudholm Group supplies high-quality trims and accessories that enhance both the performance and design of our garments. Their expertise in labelling, packaging, and trims allows us to create functional, durable, and visually distinctive products. With a strong focus on innovation and sustainability, Rudholm provides responsibly sourced materials and advanced solutions that support our environmental goals.

BIONIC-FINISH® ECO is a fluorine-free textile finish developed by RUDOLF that provides durable water repellency without harmful chemicals. It uses nature-inspired dendrimer structures to form a micro-layer on fibres, repelling water and stains while maintaining breathability. The finish is highly wash-resistant, works on all fibre types, and preserves the fabric's original look and feel. It also uses a high proportion of renewable raw materials, supporting more sustainable and environmentally responsible textile production.

bluesign® offers a comprehensive system for safe and environmentally responsible manufacturing. It works across every stage of the supply chain, ensuring products meet strict standards that prioritise human health, environmental protection, and efficient resource use. By assessing materials, processes, and chemical inputs, bluesign® helps companies reduce their ecological impact while maintaining high levels of safety and sustainability.

CORDURA® is a brand of high-performance, durable fabrics engineered for use in demanding environments such as workwear and outdoor gear. With more than five decades of innovation, CORDURA® fabrics are specifically designed to resist tears, abrasions and harsh conditions, delivering long-lasting reliability in the toughest settings.

COOLMAX® EcoMade ALL SEASON is a sustainable fibre engineered for year-round comfort. It adapts to temperature changes by wicking moisture in warm conditions to keep wearers cool and dry, while offering lightweight warmth when it's cooler. Made from 100% recycled materials, it supports environmental goals. Its durable, fibre-level construction ensures long-lasting performance, even with repeated industrial laundering, making it ideal for demanding workwear and for wearers experiencing varying temperature conditions.

A fabric technology developed for our EVOLUTION range, PULSAR® 3-layer laminate is used throughout the collection. This advanced construction consists of three key components: a high-visibility outer polyester layer, a breathable waterproof membrane that keeps water out while allowing perspiration to escape, and an inner backing layer that protects the laminate from damage. Working together, these layers provide reliable protection, comfort and durability even in the harshest conditions.

Protal delivers exceptionally comfortable garment solutions for flame-retardant and multi-hazard PPE users. By utilising a unique blend of Protex Q, cotton, and other advanced technical fibres, Protal enables the production of high-performance knitted and woven garments. These garments are trusted and worn daily by users worldwide.

RUDOLF is a trusted partner for fabric treatments, using their advanced chemical technologies to enhance the performance and functionality on our materials. As a global leader in textile chemistry, RUDOLF provides innovative and sustainable solutions, supported by strong technical expertise and reliable supply. Their treatments allow us to improve durability, protection and comfort in our fabrics, while also supporting more environmentally responsible production.

We use Sorona® fibre as a more sustainable alternative, providing built-in stretch and recovery without relying on traditional synthetic stretch yarns. Fabrics made with Sorona® maintain their flexibility and shape over time, with greater resistance to heat, UV and wear compared to elastane. In addition to its performance benefits, Sorona® is partially plant-based, using renewable raw materials and requiring less energy to produce, resulting in lower greenhouse gas emissions.

THERMOLITE® EcoMade technology enhances our garments by delivering lightweight warmth, durability, and comfort while supporting sustainability. Using a minimum of 35% recycled fibers derived from plastic bottles, it reduces environmental impact without compromising performance. The breathable structure promotes airflow, keeping wearers dry and comfortable in varying conditions. Water-resistant properties help maintain dryness, while soft hand feel enhances everyday wearability. Excellent compressibility and recovery enable easy packing and shape retention.

3M™ Thinsulate™ Elite Eco insulation is a lightweight synthetic material made from approximately 83% post-consumer recycled polyester, designed to deliver warmth with reduced environmental impact. It uses microfibres that trap air, providing high thermal performance without bulk while remaining breathable and moisture-resistant. The insulation maintains warmth even in damp conditions and is suitable for performance workwear, combining comfort, durability and sustainability by reusing materials that would otherwise go to landfill.

YKK® Group is the global standard in fastening solutions, renowned for precision, durability and innovation. Founded in Japan in 1934, the company expanded internationally in 1959 and has since become the industry leader in high-quality zippers and garment closures. From everyday apparel to specialised applications, YKK® products are trusted worldwide for their consistent performance and craftsmanship.

X

EN ISO 20471

This standard outlines the requirements for protective clothing, specifically regarding the user's presence visually. This standard intends to provide high visibility of the user in any light conditions. The standard is broken down into three classes, defined by a minimum useage of reflective and fluorescent materials. A higher class can be achieved with garment combination e.g jacket and trouser. Class 1 is the lowest, Class 2, and Class 3 is the highest.

1
2
3

EN 343

This standard outlines the requirements of the performance of protective clothing against rain, snowflakes and fog. The resistance to water penetration and water vapour resistance is also tested in this standard.

Value 1 represents resistance to water penetration, measured from Class 1-4, Class 4 being the highest level of waterproofness.

Value 2 represents the water vapour resistance, measured from Class 1-4, Class 4 being the highest permeability.

The third value represents the rain tower test, (an optional test of a ready-made garment)

EN 13758-2

This standard reflects the solar UV protective properties of a garment. Prolonged exposure to harmful UVA and UVB radiation can cause both short and long term skin damage, however this can be significantly reduced with proper protective garments. The level of protection can vary due to factors such as fabric properties and garment design.

1
2
3
4

EN 14058

This standard enforces test methods and specifies requirements for performance of a singular garment against cool environments (air temperatures above -5°C)

Value 1 represents the thermal resistance. Class 1-4, where Class 4 is the warmest.

Value 2 represents the air permeability, Class 1-3, where Class 3 is the most permeable.

Value 3 represents the thermal insulation value. Mandatory for Class 4, optional for Classes 1-3.

Value 4 is an optional water penetration test.

RIS-3279-TOM

This standard is the Railway Industry Standard for high visibility clothing. This standard outlines the requirements of high visibility garments specifically worn by staff when on the railway or near the line.

This standard is based on EN ISO 20471. Garments must achieve a minimum of Class 2 (from EN ISO 20471 standard). This specifies that only high visibility orange can achieve the RIS-3279-TOM standard.

EN ISO 11612

This standard provides guidance on the minimum performance requirements of clothing designed to protect against heat and flames. The levels of protection are indicated as:

A: Limited flame spread (A1 - surface ignition, A2 - edge ignition)

B: Convective heat (B1 - B3, B3 being the highest)

C: Radiant heat (C1 - C4, C4 being the highest)

D: Molten aluminium splash (D1 - D3, D3 being the highest)

E: Molten iron splash (E1 - E3, E3 being the highest)

F: Contact heat (F1 - F3, F3 being the highest)

EN 1149-5

This standard specifies material and design requirements for electrostatic dissipative protection clothing used as part of a total earthed system to avoid incendiary discharge of static electricity. The outer fabric of these garments is therefore made from antistatic materials and components.

Antistatic PPE is certified to EN1149-5 as this standard covers the performance requirements of the garments and refers to the choice of two different test methods (EN1149-1 or EN1149-3).

Garments meeting this standard do not offer protection from mains voltage.

IEC 61482

IEC 61482-2 is the European garment standard for the thermal hazards of an arc flash. The standard includes requirements for material testing and additional information for garments constructed from the compliant materials.

Garments certified to this standard are defined as category III and are subject to annual audits under Article 11 of the PPE Regulation.

EN ISO 11611

This standard is for protection in welding and allied processes. There is a limited flame test, and an impact of splatter test. This standard is divided into two classes, Class 1: Manual welding operations during which small amounts of splatter of molten metal are formed.

Class 2: Manual welding operations during which large amounts of droplets of molten metal are formed.
